

7 Simul (no-flip) Tutorial

memo

The method of Tommy Cherry

memo: M1,M2,M3,M4,M5,M6

It is recommended to study together with the video- <https://bit.ly/3TVVhR8>

Large letters on the black side
Small letters on the white side

M1= c-d

Always make sure to turn
the clock vertically (x2)
and not horizontally (y2)

7=-5
8=-4
9=-3
10=-2
11=-1
12=0

M2- $X+Y = (dr-r) + (U-L)$

M3 - d-r

(M3 and M4 are the opposite of what was in Tommy's video so as not to confuse the solution itself)

M4- L-U

This is the opposite of the second part of M2

M5- UR-U+C-D+l-ul+r

(You can calculate it that way too)
 $-[(U-C+D) + (ul-l) + (dr-r)]$ Look at the end of the guide

UR-U+C-D

+|-ul|+r

I take the difference between the clocks **UR** and **U**, add to **C**, find the difference of **D** with where **C** moves.

Adds this to the **l** clock, finds the difference between **ul** and the new **l**, and adds the result to **r**.

+

M6 - (u-c+d) + (UL-L) + (DR-R)

+ (UL-L) + (DR-R)

(u-c+d)

The difference between **c** and **u** will be added to **d**

+

Add the three results

solve

Pay attention to the location of the pins!

intuitive X to y

And you're done!!

The number that comes out to use its opposite

$$\text{M5 } -[(U-C+D) + (ul-l) + (dr-r)]$$

$$-[(U-C+D)]$$

The difference between **C** and **U** will be added to **D**

+

Add the three results

Another option for M5

$$+(ul-l) + (dr-r)]$$
